

## THE CARRIERE CORRECTOR

The Carriere Corrector is a unique appliance designed to specifically help in correcting an overbite. It's designed to be worn with rubber bands so that the back molars and cuspids or "eye" teeth can be moved to their correct positions. Patients wearing this appliance should be especially careful not to bite into hard foods or objects on the sides of their mouths. Because of the relatively long span of the appliance, from the eye tooth to the molar, a hard object can create tremendous leverage and result in breakage of the appliance. Replacing the appliance takes time and may require the patient being scheduled early in the day in order for the doctor to replace the appliance.

So please be careful! We have chosen this appliance because it tends to be very effective in correcting your specific bite problem. However, if the appliance breaks repeatedly, a different approach may be required to deal with the overbite.
